Trapezium

Euclid defined a *trapezium* as any quadrilateral except a square an oblong a rhombus and a rhomboid Later Greek geometers seem to have used the word in the more restricted sense of a quadrilateral with one pair of parallel sides and the word trapezoid was introduced to describe a quadrilateral which had no two sides parallel On the Continent the words are so distinguished to this day By English geometers and writers on mensuration the words got interchanged *Chambers Encyc.* vol x p 278

The *trapezium* is a quadrilateral with two parallel sides The most important form of trapezium is that in which one of the two remaining sides of the figure is at right angles to the two parallel sides The *trapezium* is then a right *trapezium* *Encyc Brit* 11th ed vol xvm p 137.

At common law the crime of treason was but vaguely defined, until by the **Treason Act** of Edward III (1351), **high** and **petit t.** received a statutory definition in England. This tho often modified or amplified by subsequent (often temporary) statutes was made perpetual by an act of 1817 Under that statute **high t.** consisted (1) in compassing or imagining the death of the sovereign or the heir apparent, (2) in having carnal knowledge of the king's wife, of the wife of the heir apparent or of the king's eldest daughter, unmarried (3) in levying war against the king in his realm; (4) in adhering to the king's enemies in his realm, giving them aid and comfort in the realm or elsewhere (5) in counterfeiting the king's great or privy seal, (6) in counterfeiting the king's money, or bringing into the realm money counterfeit to that of England knowing it to be false, 'to merchandise and make payment withal", and (7) in slaying the chancellor or any of the judges while in their places doing their offices (5) and (6) are now treated as felonies The position of treason as a special crime prosecuted by exceptional procedure was shown by its being unclergyable, unballable, and, until 1870 in England, punishable by drawing, quartering, and beheading after hanging Modern legislation, however, distinguishes between treason and treasonable crimes, which latter are now regarded as *felonies* Compare FELONY and FORFEITURE

Treason against the United States is declared by the Constitution (Art 3, sec 3) to "consist only in levying war against them or in adhering to their enemies, giving them aid and comfort" Mere conspiracy, therefore, is not treason But when war is actually levied, all who perform any act, and are actually leagued in the conspiracy, are traitors [*Bollman's Case*, 4 *Cranch Rep* 75] It has been held that rebels, engaged in an armed insurrection against the United States while they are guilty of treason in levying war against the government, can not, since they are citizens, be convicted of "adhering to the enemies" of the United States unless they unite with and sustain a hostile foreign power [*The Case of Greathouse*, 2 *Abb U S Rep* 364] Treason can be committed against a State as well as against the United States

The *Trigonometrical* Survey of Western Palestine is now an accomplished fact C R CONDER *Tent Work in Palestine* vol 1, intro p 13 [BEN & SON 1878]

— trigonometrical canon, a table of the numerical values of trigonometrical functions — **t. curve,** a curve whose equation involves only algebraic and trigonometrical functions — **t functions,** certain functions of an angle or arc used in trigonometry They are most simply defined by referring to a triangle made by drawing a perpendicular from any point A (see fig 1) of one side of the given angle *a* to the other side (If the given angle is obtuse, the reference triangle is constructed on its supplement) The functions of the angle *a* are then defined as ratios or fractions They are the *sine*, $\frac{AB}{AC}$, the *cosine*, $\frac{CB}{AC}$, the *tangent*, $\frac{AB}{CB}$, the *cotangent*, $\frac{CB}{AB}$, the *secant*, $\frac{AC}{CB}$, and the *cosecant*, $\frac{AC}{AB}$

Trigonometrical Functions 2

The position of the point A makes no difference, for all triangles so drawn for the same angle will be similar, and hence the values of the ratios will be unchanged The functions may be represented also as lines by constructing the reference triangle in a circle whose radius is taken as unity and drawing additional lines as in fig 2 The *sine* is then AB, the *cosine* CB, the *tangent* ED, the *cotangent* GF, the *secant* CE, and the *cosecant* CF These are all spoken of as the sine, cosine, etc, of the arc AD as well as of the angle *a* Another function sometimes included is the *versed sine*, or *versine*, equal to the difference between the cosine and unity (in fig 2, BD) These functions are always abbreviated in writing as follows sin *a* cos *a*, tan *a*, cot *a*, sec *a*, cosec *a*, versin *a* — **t lines,** the lines involved in the various trigonometrical functions or ratios, such as CA, CB, BA, BD, etc — **t. solution** (*Math*), the solution of a problem in trigonometrical terms or by means of trigonometry — **t. survey,** a survey accomplished by the trigonometrical calculation of lines after careful measurement of a base-line and of the angles made with this line by the lines toward points of observation generally preliminary to a topographical survey See TRIANGULATION — **trig"o-no-met'ri-cal-ly,** *adv*

Between 1879 and 1883 came Cope's demonstration that the grinding-teeth of most mammals had passed through a triangular form in the early Eocene period in which three tubercles, or a *tritubercular* structure is apparent . . . and similar names can be given to the cusps in the upper and lower molar teeth respectively [See HYPOCONE METACONE PARACONE PROTOCONE, TALON TALONID TRICONODONT, etc] . . We have very simple names for the various types of teeth in which all the tubercles passed through the same form. These teeth may be either bunodont lophodont or selenodont. There is a marvelous independent, adaptive evolution of each cusp

In its etymological sense *truth* signifies that which the speaker trows or believes to be the fact

K F Hocab *Philos* p 534 [SH & CO 1878]

In philosophical discussions as to the nature and kinds of truth two tendencies are manifest, of which one emphasizes the fidelity or self-consistency of the mind's processes, especially its judgments with one another, and the other lays greater stress on the conformity of these subjective processes with the actual states, conditions and relations of external things Thus the distinction arises between **logical truth,** or correct perception and reasoning and **ontological, metaphysical,** or **transcendental t**, or truth in fact and reality regarded as external to and independent of the perceiving and judging mind A somewhat similar distinction is made between **formal t.,** or the agreement of reasoning with logical principles and **real t**, or the agreement of the judgment with its external object With Hegel truth was synonymous with "the fully realized result Kinds of truth have also been distinguished according to the nature of their subject-matter The essential characteristic of truth is, therefore stedfast fidelity to order and law

The mind takes offence at every phenomenon of both inner and outer experience which appears to contradict that steadiness and constancy which it regards as the very essence of *truth* H LOTZE *Microcosmos* vol I, p 675, trans by Hamilton & Jones [T & T C 1885]

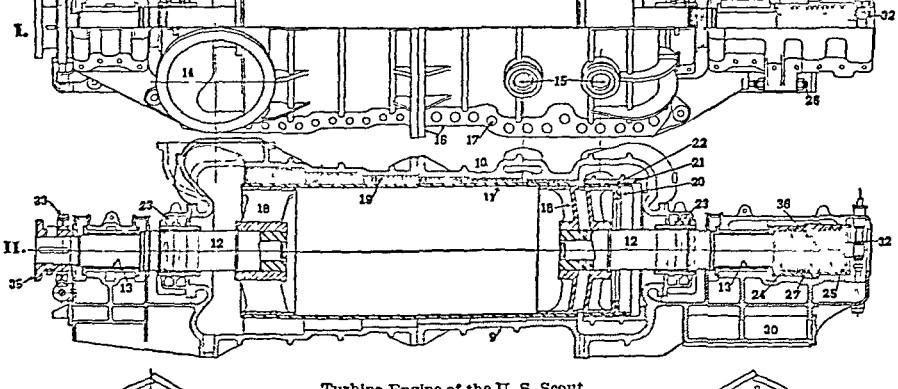
tur'bine, } 1 tûr'bin *or* -boin, 2 tûr'bin *or* -bīn, *n* 1.
tur'bin‡, } A rotary motor consisting of a series of vanes or buckets rotating on a spindle in a casing having suitable openings for the admission and escape of water which serves as the motive fluid



Unlike the ordinary type of water-wheel, the turbine relies for its efficiency upon the kinetic energy and even distribution of the water upon the vanes rather than on the pressure of the water-supply Turbines are divided into two general classes **impulse turbines** (in which rotation is effected by the direct action of the water impinging upon the vanes or buckets as in the Pelton wheel) and **reaction turbines** (in which the water enters axially and is discharged tangentially through buckets that move by its reaction as in the Fourneyron turbine) Each general class is further subdivided into **radial flow turbines** (in which the water enters from within and passes outward, known as **outward-flow turbines,** or enters from without and passes inward, known as **inward flow turbines**), **axial flow** or **parallel-flow turbines** (in which the water enters and escapes in a direction parallel to the axis of rotation as in the Jouval turbine), and **combined-flow** or **mixed flow turbines** (in which the radial and downward flows are combined, as in the Girard turbine) See PELTON WHEEL

2. A rotary motor employing steam as the motive fluid analogous in principle to the water-driven turbine [F, < L *turbo*, see TURBINAL]

Turbines propelled by steam as those propelled by water, admit of the same general classification Hero's fountain, designed about 130 B C, and Barker's mill of the 17th century, employing water and steam respectively, are the earliest known examples of the reaction type In 1838 Heath introduced the diverging conical nozzle now employed in many modern turbines as being more efficacious for transforming the expansive properties of steam into kinetic energy According to that point in its travel in which the expansion occurs, whether between or partially within the revolving elements, lies the distinction between the impulse and reaction types

Many modern turbines take the names of their inventors as, the **Curtis turbine** (an impulse turbine having usually a vertical axis and diaphragms with communicating nozles between the rotating elements The steam-supply is admitted through expanding nozles and is regulated by valves actuated by cams and levers under the control of a governor), **De Laval t.** (an impulse turbine characterized by extremely high speed The buckets are on the periphery of a disk mounted on a shaft, made flexible to diminish the vibration, which totally disappears when a certain critical speed is attained), **Parson's t** (a turbine involving principles of both the impulse and reaction types The rotating element consists of a drum having several sections of increasing diameter, each of which carries on its periphery rings of blades which rotate between rings of fixed blades on the interior surface of the case The individual rings are also of graduated diameters so that the steam-expansion is comparatively uniform They are now installed on the largest steamships, as war-ships and transatlantic liners), **Rateau t** (an impulse-reaction turbine in which revolving disks with peripheral blades alternate with fixed diaphragms having peripheral guide-blades) **Zoelly t.** (an impulse turbine having usually from 10 to 16 turbine wheels enclosed in individual compartments in a common case, the velocity acquired by the steam during each expansion affecting only a single wheel)

—**air'stur"bine,** *n* A turbine driven by air —**double t.** 1. A turbine having two sets of chutes and guides 2. Two separate turbines on a horizontal shaft, with their discharges in opposite directions —**multiple-expansion t,** a turbine in which the steam expands in successive stages **multiple-impact t.‡** —**reaction-impulse t,** a turbine in which the impulse and reaction of the water are combined —**screw-t,** *n* A propeller of small diameter revolving in a cylinder at the stern of a vessel of light draft and usually provided with blades abaft the propeller to increase the propulsive effect —**tur'bine-pump",** *n* A turbine wheel arranged to raise water by rotation in the opposite direction to that in which it would turn if used as a motor

The words tortoise, *turtle* and terrapin have been used indiscriminately Some writers embrace both the terrestrial and semi-aquatic species under the term tortoise thus —land tortoises and water tortoises while they apply the name *turtle* to the marine species only Others designate semi-aquatic and marine species as *turtles* and place the strictly terrestrial chelonians under the head of tortoises Terrapin is a term that has been applied at one time or another among all of the groups.

The invention of movable types is often popularly referred to as the invention of printing, since it made cheap printing possible In some modern (so-called) typesetting-machines the individual type is dispensed with, and the line becomes the movable unit (See LINOTYPE TYPE-BAR) Metal types are cast in a mold and, according to the point system, now generally adopted are 918 of an inch in height They are usually nicked on the body-plane that is turned from the compositor in setting, or sometimes on two planes for distribution by a mechanical distributor Types of large size, as for poster-printing, are made of close-grained wood as apple maple, boxwood, etc, the end of the grain being placed upward and subjected to pressure to give it a finish Rubber types are much in use for hand-stamps, etc, and usually have a metal body half an inch or less in length, and a soft rubber face Metal type is sometimes **copper-faced** by electrodeposition to add to its wearing qualities Type is **high-spaced** where shoulder-high spaces are used for electrotyping, otherwise **low spaced**

The differences in printing-types, as to body or size, are shown in the list below differences in width render the type fat or lean or, if quite marked, extended or condensed differences in face are almost endless The body of this dictionary is in roman face the vocabulary words are in full-face, the headings Ant, Syn, Prep in antique and cross-references in small caps See CLARENDON ENGLISH BLACK LETTER GOTHIC ITALIC RUNIC SCRIPT, POINT SYSTEM

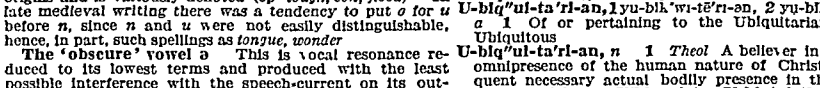
Roman Black Letter Script Revised Scientific

U, u, 1 yū, 2 yu, *n* [UES, U's, or *Us*, 1 yūz, 2 yus, *p'*] **1.** A letter the twenty-first in the English alphabet It was originally the sign of the vowel heard short in *pull*, long in *pool* In uttering it the back part of the tongue is raised high and the lips are fully rounded to the *w* position, whence the name 'high back round We denote the sounds by u and ū, tho the latter is not a mere prolongation of the former, but has more of lip rounding More commonly in modern English however, the letter *u* denotes one of the vowels heard in *use, penury, tube, but, turn* These must be considered separately

The u of *full, push* is comparatively rare in modern English— 44 of one per cent, according to Whitney— having been largely replaced by u (see below) It is sometimes written *oo* (*good*), *ou* (*could*), and *o* (*woman*) The pure ū is denoted by *u* only after *r, l sh* (*rule, lute, sure*), and even thereit tends in the United States, to be replaced by iū (see below) Its commonest sign is *oo*, other signs are *ou, o, ut* (*soup, move fruit*) The u sound, written *oo*, often represents Anglo-Saxon ō *mōna*, > *moon, fōda*, > *food*

Long u is the name popularly given to the diphthongal *u* of *use* (hence the name yū), and to the *u* of *tube* which may or may not be diphthongal Of the two varieties one is simply the above-described ū fully rounded and preceded by y The other is less rounded and has no y, tho the middle part of the tongue is slightly raised It is a 'mid-mixed' vowel, which we denote by ıu when short, as in *mutation*, by iu Its ordinary signs are *u, ue, ew, eu, ui* (*mute, due, new feud, suit*) Like the diphthongal yū, it comes from the high French *u*, which first became yu, then yū Since *r* and *l* are not easily followed by *y*, the tendency has been to keep the old ū after these consonants, while converting it into yū or iū after the others Thus *rule, lute* are usually pronounced in England, rūl, lūt but *tube, mute, duty* become tyūb, myūt, dyū'tı In the United States iū is more common in this class of words and is often heard even after *r* and *l*, thus many distinguish *rood* (rūd) from *rude* (rūd), and *loot* (lūt) from *lute* (liūt)

The 'long *u* s' are reported by Whitney as making up two per cent of the sounds in our literature



Short u The sound popularly so called, the ŭ of *but*, which we denote by *u*, is a 'low mixed vowel' In uttering it there is no rounding of the lips The tongue-position is nearly the same as for a the difference between a and u being due to a different shaping of the resonance-chamber by the action of the soft parts of the faucal passage The long form ū is heard only before *r*, as in *burn* The quality of ŭ is slightly different from that of u, some regard it as a prolongation of ə rather than of *u* (see below) While the most of the modern u s are descended from u and still written *u* (cp *lust*, < AS *lust*), the sound has also other origins and is variously denoted (cp *tough, son, flood*) In late medieval writing there was a tendency to put *o* for *u* before *n*, since *n* and *u* were not easily distinguishable, hence, in part, such spellings as *tongue, wonder*

The 'obscure' vowel ə This is vocal resonance reduced to its lowest terms and produced with the least possible interference with the speech-current on its outward passage It is the sound to which all the low vowels, to some extent also *e* and *i*, tend when not fortified by the accent It is technically a mid-mixed' vowel, closely akin to u, but differing from it by its weaker resonance (cp the second vowel of *humdrum* with that of *tantrum*, which is virtually identical with that of *monarch, ever, fagot, martyr*)

According to Whitney, *u* makes up about two per cent and ə about three and one-half per cent of the sounds in our literature W D WHITNEY *Oriental and Linguistic Studies* second series, pp 223, 233

Capital U is from Roman **U** < Gr ϒ differentiated by the Greeks from the signs for consonant *u* = *w*, old Greek 𐌖 Ϝ < Phenician 𐤅 waw or vau, from which F also is derived (For earlier history, see F) F, U, V, W, Y are all from Phenician *vau* Latin V U were graphic variations merely, and *v u* continued to be so to the 16th century In the 9th century runic w came into use in Anglo-Saxon The rune for *u* is the second in the futhorc it is named *ūr*, ox

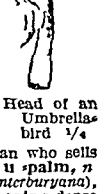
Umbrella of the Anglo-Saxon Period (From Harleian MS No 603, in the British Museum, London)



Umbrellas, the seen in Egyptian and Assyrian sculpture, on Greek vases and figurines, and in medieval manuscripts, were not used in Europe as shelters from rain until the 15th century In the East, as in Siam, they are emblems of royalty

Known in England in Anglo-Saxon times mentioned by Drayton (1620), Swift (Cit's Shower 1710), it (the *umbrella*) was assigned in Queen Anne's reign to women

Nelson's Perpetual Encyc vol III p 256

Jonas Hanway was not the first to introduce the *umbrella* to England although he revived its use In the Harleian Manuscripts there is proof beyond doubt that umbrellas were known to Anglo-Saxons, for in No 603 of these there is the figure of a yeoman holding an umbrella over his lord Beck asserts (Draper's Dictionary) that at the time that Stephen usurped the crown of England *umbrellas* were in common use FRANK H VIZETELLY *The Sunshade and the Umbrella* in *The New Age* May, 1909, p 415

um'laut, *n* *Philol* **1.** A change of one vowel to another more like a following *a*, *i*, or *u*, as of *a* followed by *i* to the intermediate sound *e* *man* + *i* > *meni* It took place regularly in early German, Scandinavian, and Anglo-Saxon It should be distinguished from those significant changes of the verb-root in inflection which are produced by accent these are called *ablaut* See ABLAUT, and VOWEL-GRADATION

The umlaut produced by *u* is not now found in German *Umlaut* was sometimes represented by writing a small letter above *a*, *o*, *au*, or *u*, or by writing the two side by side, or (as now in German, Danish, and Swedish) by dots ( ) above the mutated vowels, as, *lamm*, pl *lammer*, *sohn* pl *sohne*, *haus*, pl *hauser*, *qual*, *qualen*, etc It has ceased to act in modern English, but the old changes survive in many words, as in the so-called irregular plurals (*men*, *geese*, *mice*, *brethren*, *kine*, etc) and derivatives, as *gild* < *gold*, *heal* < *hāl* (whole), *English* < *Anglise*, *French* < *Frankish*, etc It is still active in Icelandic, but was not found in Gothic

The *Umlaut* is a modification that has risen in our stock of languages within the historical period There is no trace of it in the Mœsogothic, but it appears in the Old High German and Anglo-Saxon The Conquest gave the death-blow to the *Umlaut* among us

un-, *prefix* Not used to express negation, incompleteness, or opposition

Un- may be prefixed to most adjectives and adverbs and, rarely, to nouns

In- as a prefix to adjectives expresses in usage more of negation *un-* more of mere privation, as, a child is *unartistic* speech a writer is *inartistic* in diction In general, *in-* is more confined to words of Latin origin

[< AS *un-*, = L *in-*, = Gr *an-*, *a-*, not]

un-², *prefix* Back used to express the reversal of the action of the verb It is also prefixed to nouns to make a verb denoting deprivation of the state or quality expressed by the noun as to *unhorse* In some cases *un-*, when prefixed to a verb simply intensifies the negative idea of the verb, as to *unloose* [< AS *un-*, *on-*, *ond-*, *an-*, *and-* back]

The following is a list of unimportant or self-defining words beginning with *un-* (1) In the verbs in the list, *un-* gives the sense of reversal (see UN-² above) as, *unanchor*, 'to weigh anchor', *unattire*, 'to undress (2) In the nouns and the adjectives (including participles in *-ing* and *-ed*) it has simple negative force (as in *uncharity*, 'lack of charity', *unabiding*, 'not abiding', *unaided*, 'not aided or assisted' see UN-¹), except in such of the words in *-ed* and *-ing* as may be regarded as participles of a corresponding verbal form in UN-² Thus *unburdened* may be regarded as an adjective (UN-¹ + BURDENED) meaning 'not burdened,' or as a participle of the verb *unburden*, meaning 'relieved of a burden' (3) Many of the adjective forms have derivative adverbs in *-ly* and nouns in *-ness* and *-ity* whose meanings are evident Where doubt exists consult the primitive and suffix Definitions are given in vocabulary place where required, as, for example, *unconscionable*, of which the primitive form is no longer in use *unbelief*, which has a strongly positive, and not merely negative meaning

Coleridge and others, however, strove to reestablish the distinction as emphasized by Kant and Hegel in Germany and embodied in the words *Vernunft* (reason) and *Verstand* (understanding) but it has been adhered to only somewhat fitfully and irregularly in subsequent psychological and philosophical writings A certain justification for Locke's dictum The power of perception is that which we call the *understanding*, is to be found in the fact that all sense-perception and self-consciousness involve interpretation See APPREHENSION, INTUITION, REASON

duce unit magnetic flux (see OERSTED, below), **u. magnetomotive force** (M M F), a magnetomotive force producing unit magnetic flux through a magnetic circuit with unit reluctance, a magnetomotive force producing unit magnetizing force through unit length of magnetic circuit (see GILBERT, below), **u. electromotive force** (E M F), the electromotive force in a circuit which does unit work in unit time when the unit current is flowing, the E M F produced in a circuit in which there is unit change in the magnetic flux in unit time, **u resistance,** the resistance of a circuit in which unit electromotive force produces unit current, **u of self-inductance** or **of mutual inductance,** an inductance such that unit electromotive force is induced when the inducing current is changing at the rate of one unit in unit time

The electrical units with their relations and their dimensions, according to both the electrostatic and the electromagnetic systems, are shown in the second column of the table of magnetic and electrical units

A **practical system** of electrical units of convenient magnitudes was established by the Electrical Congress (Paris, 1881) The ratio of a practical unit to the corresponding unit in the C G S electromagnetic system is some multiple of 10, as given in the table below Any unit in practical use might, in a sense, be termed a practical unit, more properly, however, the practical units constitute a system derived from a fundamental unit of length of 10^9 centimeters (an earth-quadrant), a unit of mass of 10^{-11} grams, and a unit of time of one second Since the units in any consistent system are so related that a formula expressing a physical law will hold true for any such system if true for one, any such law, as Ohm's law that the current is equal to the electromotive force divided by the resistance, holds equally true for C G S and practical units Thus, practical units may be substituted in any one of the defining equations in the large table For example, the capacity of a condenser expressed in farads is equal to the quantity of electricity in coulombs divided by the electromotive force in volts, and similar relations hold for the other units The practical units, as defined by the International Congress of Electricians (Chicago, 1893), and confirmed in substance by the International Conference (London, 1908), are as follows **u of resistance,** the *international ohm*, represented by the resistance offered to an unvarying electric current at the temperature of melting ice by a column of mercury 14 4521 grams in mass, of a constant cross-sectional area, and 106 3 centimeters long, **u. of current,** the *international ampere*, represented by the unvarying current which, when passed through a solution of nitrate of silver in water, in accordance with certain specifications, deposits silver at the rate of 0 001118 of a gram per second **u of electromotive force,** the *international volt*, the electromotive force that steadily applied to a conductor whose resistance is one international ohm, will produce a current of one international ampere, **u. of quantity,** the *international coulomb*, the quantity of electricity transferred by a current of one international ampere in one second, **u. of capacity,** the *international farad*, the capacity of a condenser charged to a potential of one international volt by one international coulomb **u. of work,** the *joule*, represented by the energy expended in one second by an international ampere in an international ohm, **u of power,** the *watt*, represented by the work done at the rate of one joule per second, **u of inductance,** the *henry*, the inductance in a circuit when the electromotive force induced in this circuit is one international volt, while the inducing current varies at the rate of one ampere per second The practical units are all defined in terms of the ohm and ampere as specified above The units of the practical or ohm-ampere system, and the relations between them and the C G S units are as follows

PHYSICAL QUANTITY	Unit in Practical or Ohm-ampere System	Ratio of Practical Unit to C G S Unit	
		Electro-magnetic	Electrostatic
Quantity	Coulomb	10^{-1}	$v^*\times10^{-1}=3\times10^9$
Current	Ampere	10^{-1}	$v\times10^{-1}=3\times10^9$
Electromotive force	Volt	10^8	$10^8-v=1/3\times10^{-2}$
Resistance	Ohm	10^9	$10^9-v^2=1/9\times10^{-11}$
Capacity	Farad	10^{-9}	$v^2\times10^{-9}=9\times10^{11}$
Self-induction	Henry	10^9	$10^9-v^2=1/9\times10^{-11}$
Mutual induction	Henry	10^9	$10^9-v^2=1/9\times10^{-11}$
Work	Joule	10^7	10^7
Power	Watt	10^7	10^7

* v = velocity of light = 3×10^{10} cm per second

The **magnetic units** of the *practical system* are not used on account of their inconvenient magnitudes The C G S electromagnetic units for these quantities are accordingly used and are commonly designated simply as C G S units The International Electrical Congress at Paris, 1900, assigned the name **maxwell** to the C G S electromagnetic unit of flux, Φ, and the name **gauss** to the C G S electromagnetic unit of flux-density, $\mathfrak{B}$, one gauss being equal to one maxwell per normal square centimeter Not uncommonly the gauss is also used as the unit of magnetic field, $\mathfrak{H}$

The **gilbert** is frequently used for the C G S unit of magnetomotive force, the same being produced by 0 7958 ampere-turn approximately, and the **oersted,** for the C G S unit of reluctance

For other units, not treated in this article, see CALORY, and tables under COIN, MEASURE, and WEIGHT

The question as to the reality or nature of the existence of universals has been hotly debated especially by the different schools in medieval Scholasticism. The answers given to this question are customarily divided into three general classes (1) That of the *Realists,* who regarded universals as really existing entities or types, which may be intuitively discerned or get themselves copied by the rational mind (2) that of the *Nominalists,* who as represented by Roscellin in extreme form, denied the existence in reality of universals or of any beings corresponding to them, and asserted that universals are themselves mere names and (3) that of the *Conceptualists,* who affirmed the existence of universals as mental constructs only. Modern psychology has rather directed the point of inquiry to the relations sustained by the notion or logical universal, to the concrete idea or representative image.

A university may take charge of the instruction of the students whom it afterward examines for a degree, as in Germany and the United States or it may do little or no teaching merely examining private students and conferring degrees Universities arose in Europe in the middle ages, and were at first essentially ecclesiastic. Their functions gradually became specialized some dividing into several *faculties* each of which took charge of some one great branch of instruction, as now in Germany, or into *colleges,* subordinate teaching bodies as now in the older English universities where the relation of the university to the college is similar to that of a federal government to its component states In the United States the word has been used loosely, and many institutions that are nominally universities have a standard lower than that of others called colleges but there is a general *tendency* to restrict the word to institutions offering non professional instruction beyond the bachelor's degree, and having affiliated professional schools Compare COLLEGE

-ure. A substantive ending found in nouns denoting action or the product or result of action, and usually attached to the past participle stem as, *censure*, *picture*. [= F. *-ure*, < L. *-ura*, fem. substantive ending]

Ure, 1 ūr, 2 yur, **Andrew** (?/ni1778–1857). A Scottish chemist and author, *Dictionary of Chemistry*.

u're-a, 1 yū'rē-ə; 2 yu'rē-ə, *n.* *Chem.* 1. A very soluble colorless crystalline compound ($CO(NH_2)_2$), contained abundantly in the urine of mammals, and in small quantities in their various organs and in their blood and other fluids. Urea is also found in slight proportions in the excrement of birds, fishes, and reptiles. It is formed by the oxidation of nitrogenous compounds in the body, or taken as food. A man of average weight eliminates during twenty-four hours about an ounce of urea, which is increased by excessive muscular exercise or abnormal nitrogenized diet. In the system it is produced from proteids by metabolism. Urea has a toxic effect on the system when retained or when administered. Chemically it is a diamid. It may be made synthetically by the reaction of potassium cyanate with ammonium sulfate. This synthesis, made by Wöhler in 1828, was the first artificial preparation of an organic compound, a process until then considered an impossibility, and thus began a new era in the development of that branch of organic chemistry.

2. A carnivore of urea. [< Gr. *ouron* urine] **car-bam'idē**.—**dialy'l urea**, same as SINAPOLIN.—**oxalyle u.**, same as PARABANIC ACID.—**u re-al**, *a.* Of or pertaining to urea.—**u"re-am e-ter**, *n.* A form of apparatus used for the estimation of the amount of urea contained in urine. **u"re-om'e-tər**.—**u"re-am'e-try**, *n.* The estimation of the amount of urea contained in urine or the process used in such an estimation.—**u're-ase**, *n.* Same as URASE.

One Form of Ureameter.

The base arm of the ureameter is filled with a strongly alkaline solution. A cubic centimeter of urine is then delivered into the base arm (a) by pressure on the rubber pressure bulb (b). The scale (c) measures from the volume of nitrogen gas evolved the weight of urea in a cubic centimeter of urine.

—**uric acid**, a white, tasteless, almost insoluble compound ($C_5H_4N_4O_3$) of varying crystalline forms, obtained chiefly from the excrement of serpents and birds (guano), in which it is combined with alkaline bases. It is found in small quantity in human urine, from 6 to 12 grains being eliminated during 24 hours, as sodium, ammonium, etc., urates. Owing to its insolubility, it forms the nucleus of most urinary and renal calculi, whence it was called formerly **lithic acid**. Gouty deposits in the joints are mostly sodium urates. Uric acid is a product of the incomplete oxidation of animal tissue and animal diet, and may also be formed synthetically by heating a mixture of glycol and urea. Compare UREIC.

u'rine, 1 yū'rin, 2 yu'rin, *n* In man and other animals, a pale-yellow fluid with an acid reaction, secreted from the blood by the kidneys, stored in the bladder, and voided periodically, generally at will, through the urethra the principal vehicle by which nitrogenous and saline matters derived from impaired tissues are removed from the system.

The normal urine of man has a specific gravity of 1 015 to 1 030, and the quantity voided in 24 hours is about 50 ounces, including nearly 2 ounces of solids. Of these solids the chief constituent is urea, and then follow, in the order of their quantity, sodium chlorid, phosphates, sulfates uric and hippuric acids, and pigments and extractives. All the ingredients vary according to the health, food, and physical condition of the person, and the climate. Many diseases readily manifest themselves by ingredients found in the urine: for instance, an excess of grape-sugar is indicative of diabetes: hence the value of urinalysis in pathology

Urine is often specifically named from its appearance or character, especially as indicative of morbid bodily condition: as, **diabetic urine** (containing much glucose), **dropsical u., febrile u.** (dark, odorous), **gouty u., hysterical** or **nervous u.** (profuse, watery, light-colored), **milky u., mucilaginous u., rickety u., smoky u.**

A number of the disorders of the urine as regards its reaction and relative composition, can be traced to dyspepsia hepatic derangement and defective oxygenation or metabolism and even albumen sugar and bile may find their way into the urine from the same causes One striking disorder of the urine is characterized by unnatural alkalinity and by its effects in precipitating certain solid constituents The urine is turbid from precipitation of phosphates and carbonates and these are deposited in the passages, causing pain and irritation. . . . A similar disorder of the urine is characterized by excessive acidity. This has different causal relations but the ultimate effects are practically similar — the precipitation of uric acid, and possibly the formation of calculus Excessive acidity is chiefly met with in the sub acts of disorder of the liver from indulgence in proteid food.

u'su-ry, 1 yū'zu-ri, 2 yu'zhu-ry, *n* [-RIES, 1 -riz, 2 -riş, *pl*] **1.** Originally, the act or practise of lending money at interest, or of taking interest for money so lent. now archaic except in the sense of exorbitant or extortionate interest, specif (*Law*), the demanding and taking, or contracting to receive, for the use of money as a loan, a rate of interest beyond what is allowed by law

At the present day, '*usury*' if used in the old sense of the term, would embrace a multitude of modes of receiving interest upon capital to which not the slightest moral taint is attached The man who does not in some shape or other lend his capital upon '*usury*' is in the modern world generally considered as lacking in his duty to himself or his family The change in the moral attitude toward *usury* is perhaps best expressed by saying that in ancient times so much of the lending at interest was associated with cruelty and hardship that all lending was branded as immoral (or all interest was *usury* in the moral sense), whilst at present so little lending takes place comparatively, except on commercial principles, that all lending is regarded as free from an immoral taint This change in the attitude of common-sense morality in respect to anything that is lent upon *usury*' is one of the most peculiar and instructive features in the economic progress of society

Roman Black Letter Script

V, v, 1 vī, 2 vē, *n* [VEES V's, or Vs 1 vīz 2 vēz *pl*] **1.** A letter, the twenty-second in the English alphabet. Its sound is produced by sending the speech-current through a very thin aperture between the lower lip and the upper teeth, with the vocal cords vibrating and the nasal passage closed. It is technically a 'labiodental voiced spirant' or "fricative." The corresponding voiceless spirant is *f*.

In Anglo-Saxon there was no letter *v*. Its sound being denoted by *f*, rarely by *u*. In Middle English *u* came into common use for the voiced *f*, and this *u* was finally differentiated into *v*. AS *lufu, lif, hafene* > ME. *loue, leues, haven* > *love, leaves, haven*. Most of the modern *v*'s in words of Germanic origin, have resulted thus from the voicing of an earlier *f*. So long as *u* was used for *v* the letter could not very well end a word: *hau* for *have* would have been ambiguous. The rule against final *v* has survived the reason for it. There is no longer a phonetic objection to such spellings as *har, stir, lear*.

The great mass of initial *v*'s and some that are not initial, come ultimately from L. *v* which was at first bilabial, but became labiodental in the 2d century A. D. and remained so in the derived languages: L. *vocem* > Fr. *voix* > *voice*, L. *lavare* > *lave*. A few represent L. *b* or even *p*: cf. *govern river*, ultimately from L. *gubernare, ripa*. So too, in Germanic words, an earlier *b* between vowels appears in English as *v*: *raven knave*, G. *Rabe Knabe*.

V is, after *n*, the most frequent of the labial sounds, and averages 2.37 per cent. of all the sounds in English literature according to Professor Whitney's examination. W. D. Whitney *Oriental and Linguistic Studies* second series, p. 274. [s 1874]

Capital V is a Latin letter, a graphic variation of U, better suited to the chisel < early Greek ϒ Ꝩ < Phenician ϒ < Egyptian hieratic < hieroglyphic, a cerastes, whence come F, Y, W. The characters V U, v u, meant the same sound in Latin, Norman-French, and English as late as the Elizabethan period. They were counted as one in alphabetic arrangements until lately, like *I i*, and *J j*. *V* was commonly called "single *u*" as *w* was "double *u*" so late as 1617. For lower case, black letter dates, etc., see F and U.

The sound of our *w*, which was denoted in Greek by F was retained in Latin by *V*. The sound of *v* which is the dental equivalent of the guttural *w* seems to have been wanting in Greek and Latin as in many other languages. If the Latin *V* had been pronounced as *v* its name would have been *ev* as in the case of *ef* and the other continuants. The name *ve* shows that it was a stopped consonant and hence the sound must have been *w*.

Syn.: blank, empty, unemployed, unfilled, unoccupied, vacuous, void, waste. That is *empty* which contains nothing; that is *vacant* which is without that which has filled or might be expected to fill it. *Vacant* has extensive reference to rights or possibilities of occupancy. A *vacant* room may not be *empty*, and an *empty* house may not be *vacant*. *Vacant*, as derived from the Latin, is applied to things of some dignity, *empty*, from the Saxon, is preferred in speaking of slight, common, or homely matters, tho it may be applied with special force to the highest: we speak of *empty* space, a *vacant* lot an *empty* dish, an *empty* sleeve, a *vacant* mind, an *empty* heart, an *empty* boast. A *vacant* office, a *vacant* hour. *Void* and *devoid* are rarely used in the literal sense, but for the most part confined to abstract relations, *devoid* being followed by *of* and having with that addition the effect of a prepositional phrase as the article is *devoid of* sense. the contract is *void* for want of consideration. *Waste* in this connection, applies to that which is made so by devastation or ruin, or gives an impression of desolation, especially as combined with vastness probably from association of the words *waste* and *vast*. *waste* is applied also to uncultivated or unproductive land, if of considerable extent: we speak of a *waste* tract or region, but not of a *waste* city lot. *Vacuous* refers to the condition of being *empty* or *vacant*, regarded as continuous or characteristic. — Ant.: brimful, brimmed, brimming, busy, crammed, crowded, filled, full, gorged, inhabited, jammed, occupied, overflowing, packed, replete. — **vacant succession,** a condition in which there is no heir, as, *vacant succession* to a throne. — **va'cant-ly,** *adv.* — **va'cant-ness,** *n.*

Vase with Principles of Design

Ancient vases, largely of Greek origin and dating back to the 18th or 20th century B C, may be classed as (1) wine-, water-, or oil-vases as the *amphora*, *pelike*, and *stamnos*, (2) water-jugs as the *hydria* and *kalpis*, (3) vessels for mixing wine and water, as the *crater kelebe*, and *oxybaphon* (4) vessels for pouring wine, as the *œnochoe*, *olpe*, and *prochoos*, (5) cups or bowls for drinking, as the *cantharus*, *cyathus*, *scyphus*, *kylix*, *phiale* and *rhyton*, and (6) vessels for containing ointments and perfumes, as the *lecythus*, *alabastrum*, and *bombylius*

Proportions for a vase may be obtained thus Draw a circle on the diameter of the proposed vase, and a larger but concentric circle through the base If the greater circle be divided by radii into 16 equal parts, and lines be dropped vertically from the intersection of these radii with the smaller circle the points of intersection of these verticals with the corresponding chords of the larger circle will give guiding-points for the proper outline The arrangement of foot neck and handle is a matter of taste

The word *vase* enjoys a distinction of having four different pronunciations, if indeed we cannot say five Of these three at least were in existence from the beginning Two of the pronunciations affected the sound of *s* two that of *z* In the case of the consonant variation the word according to one method rhymed with case according to the other with daze There was also a difference about the pronunciation of the vowel There was one sound in which a would be represented by aw One of the earlier ways of spelling the word was *vause* But there was another pronunciation in which the vowel had the force of a in father This second pronunciation of the vowel did not make itself much felt until the latter half of the 19th century T A LOUNSBURY *The Standard of Pronunciation* pp 39–42 [H 04]

Principle of the Vernier

The vernier ab which corresponds in length to 9 divisions of the fixed scale AB, is divided into 10 equal parts When the ends coincide as in the first figure the 10th or end line of the vernier is just opposite a line on the fixed scale If the vernier be pushed toward the right so that the first marks on the two scales are opposite it will have been moved just one tenth of a scale-division for this is the difference between the two scales If the second lines are opposite it will have been moved two-tenths, and so on Hence the exact position of the end may be known by observing which lines are opposite each other In the second figure the rod *mn* evidently measures 4 divisions and a fraction and since the eighth line on the vernier is opposite a line on the fixed scale, that fraction is just eight-tenths
